

HelloMac

App for making calls via iPhone on older versions of macOS.

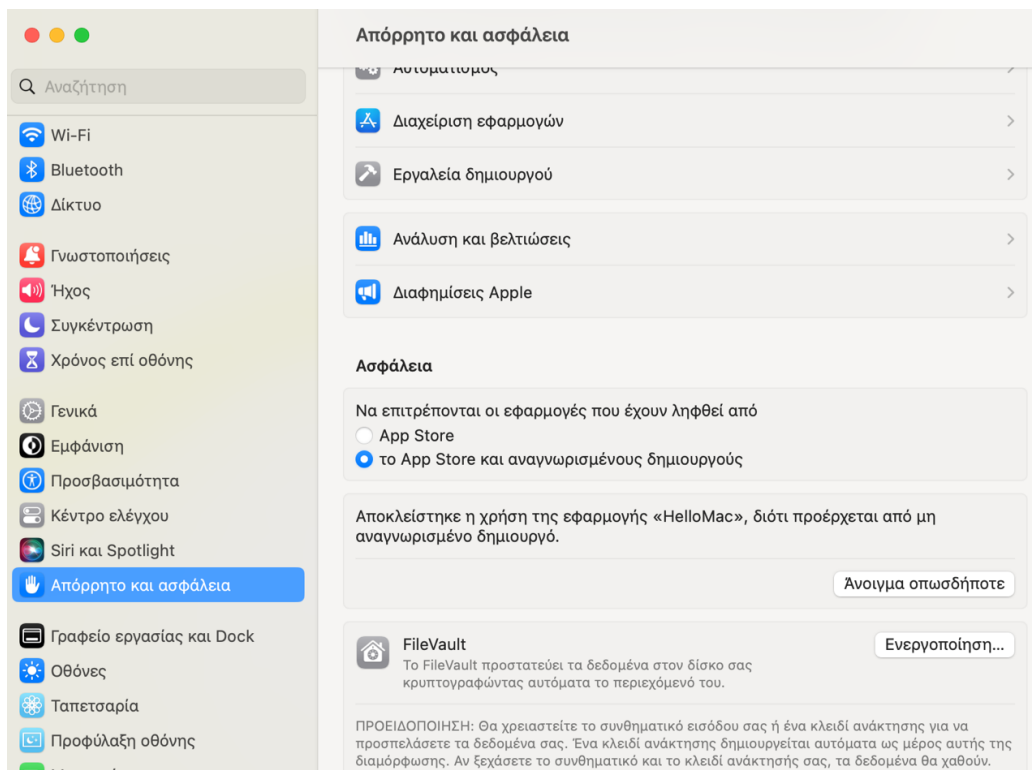

First-Launch Issue: "Unidentified Developer"

If you see the message below the first time you launch HelloMac, follow the steps below after first clicking **OK**.

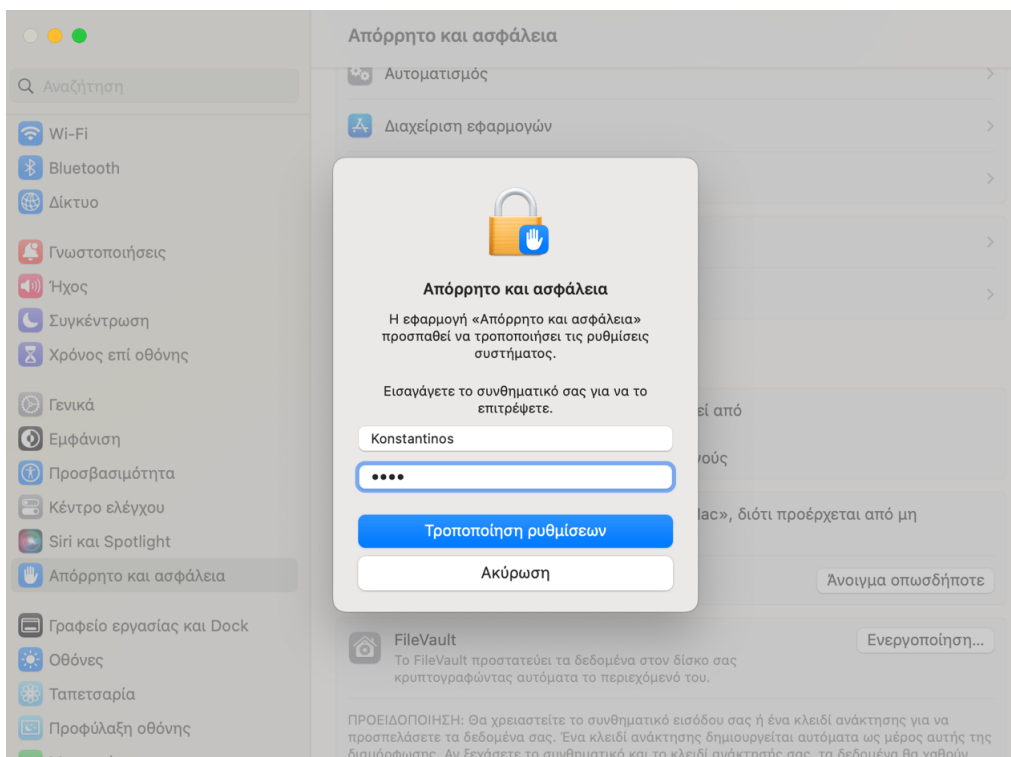

On-screen text (translated): "'HelloMac' cannot be opened because it is from an unidentified developer. macOS cannot verify that this app is free from malicious software. Firefox: downloaded this file today at 10:25 AM." — Click **OK**.

1) Go to System Settings, then the Privacy & Security category. Find the message "HelloMac was blocked from use because it is from an unidentified developer" and click Open Anyway.

On-screen text (translated): Privacy & Security settings pane, showing Automation, Application Management, Developer Tools, Analytics & Improvements, Apple Advertising, and the Security section with the option "Allow applications downloaded from: App Store" / "App Store and identified developers" (selected), the blocked-app notice for HelloMac with an **Open** **Anyway** button, and FileVault settings.

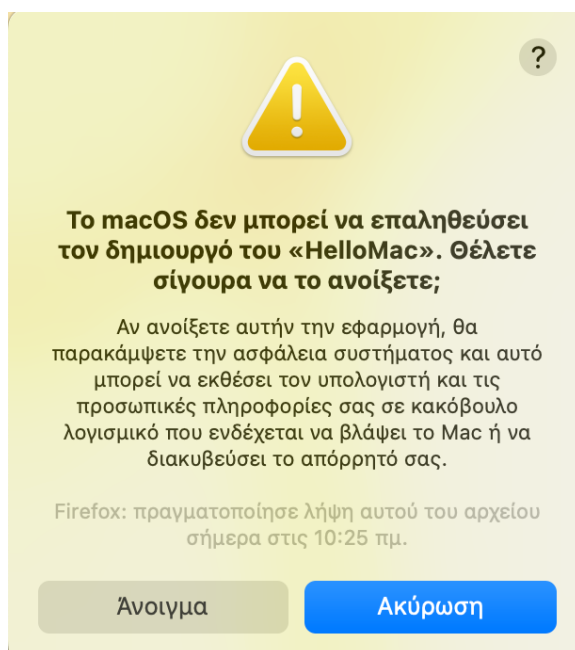

2) A dialog box will appear. Type your password and click **Modify Settings**.

On-screen text (translated): "Privacy & Security is trying to modify system settings. Enter your password to allow this." Fields for username and password, with buttons **Modify Settings** and **Cancel**.

3) Close **System Settings**.

4) The first time you open the app, the message below will appear. Click **Open** and you're all set!

On-screen text (translated): "macOS could not verify the developer of 'HelloMac'. Are you sure you want to open it? If you open this app, you will bypass system security, which could expose your computer and personal information to malicious software or compromise your privacy. Firefox: downloaded this file today at 10:25 AM." — buttons: **Open** / **Cancel**.
